**Abstract of JP 10013756 (A)**

**PROBLEM TO BE SOLVED:** To execute the reservation of a program by a viewer without mistake by comparing reservation information with program table information corresponding thereto and updating reserved program information when the contents are updated. **SOLUTION:** A reservation information management section 15 stores reservation information of a program reservation and a group reservation to a reservation information DB 14 for the management and accepts an additional request of reservation information from a program table display/operation section 13 and accepts a delete request of the reservation information from a reservation execution section 17 or a reservation table display/operation section 16. The reservation execution section 17 reads program information a little before a broadcast start time with respect to a program whose broadcast start time is closest based on the contents of the reservation information DB 14 and compares it with contents of a program information DB 10 to confirm whether or not a broadcast start time is changed. When changed, the contents of the reservation information DB 14 are updated and then the program reserved by the viewer is displayed without mistake.
